

Manguiat, Sherrie Ann G.
Part A — Manual Testing

1. List five (5) to ten (10) manual test cases that you consider critical for testing the TodoMVC application.

- 1. Add a Todo**
 - Input a task in the text box and press Enter.
 - Verify it appears in the list.
- 2. Mark Todo as Completed**
 - Click the checkbox next to a todo.
 - Verify it moves to “completed” state (strikethrough or visual change).
- 3. Edit a Todo**
 - Double-click a todo, change text, press Enter.
 - Verify the text is updated correctly.
- 4. Delete a Todo**
 - Click the delete (×) button for a todo.
 - Verify it is removed from the list.
- 5. Filter Todos**
 - Click “All,” “Active,” and “Completed” filters.
 - Verify the correct todos are displayed for each.
- 6. Clear Completed Todos**
 - Mark todos as completed, then click “Clear completed.”
 - Verify completed todos are removed; active todos remain.
- 7. Persistence on Refresh**
 - Refresh the page.
 - Verify whether todos remain (depends on implementation; most demos reset).

2. In three (3) to five (5) sentences, explain how you would conduct exploratory testing for TodoMVC.

For exploratory testing of TodoMVC, I would interact with the app without a strict script, trying different sequences of actions. For example, I would add multiple todos, mark some as completed, edit, delete, and filter them in various orders. I'd also try edge cases like empty input, very long text, or special characters. Finally, I would refresh the page to check data persistence and observe any UI glitches or unexpected behavior. The goal is to uncover issues that structured test cases might miss.

3. Write one (1) sample defect you might encounter in TodoMVC.

Title: Edited to-do text reverts after page refresh.

Description: When a user edits an existing todo item and refreshes the page, the edited text is lost and the original text reappears.

Steps to Reproduce:

1. Add a new todo (e.g., "Buy milk").
2. Double-click the todo to edit it.
3. Change the text to "Buy bread".
4. Press Enter.
5. Refresh the page.

Actual Result:

1. The todo shows "Buy milk".

Expected Result:

1. The todo should persist as "Buy bread".

Severity: Medium
